LRU force skips (-lruskips): The number of times to access a buffer in the Primary Buffer Pool before moving it to the end of the LRU chain. In FWD terms it is the number of times a record is read before it is touched in the FFC, this is primarily needed to reduce the load on the cache which is shared across sessions when multiple records are frequently touched.

Is -lruskips an OE command line option?

#4 - 08/19/2026 06:43 AM - Artur Şcolnic

It is an OE database startup option.
