#1 - 09/18/2012 06:00 PM - Greg Shah

Implement deadlock safety code for concurrent dependencies. At load time, check if the number of configured threads is equal to or greater than the number of concurrent tests (in the same group). At runtime, check that the number remaining threads (that did not get aborted via the ABORT_THREAD failure mode) is equal to or greater than the number of concurrent tests in the given concurrent group.
