This system handle is **almost** too implementation specific to support. But if the usage is important, the features can be duplicated. We may have to record additional data at conversion time into the name mapping DB or into the class, to provide this.

The basic usage is to set the FILE-NAME attribute to the name of a .r or .p (will search the PROPATH to find it if not fully qualified). If found, then the other attributes can be read, including:

CODEPAGE
CRC-VALUE (.r CRC value)
DB-REFERENCES (the list of logical DB names referenced in this program)
HANDLE
INSTANTIATING-PROCEDURE
IS-CLASS
LANGUAGES
MD5-VALUE
TABLE-CRC-LIST
TABLE-LIST
TYPE (always returns PSEUDO-WIDGET?)
