Currently, the file_sys.xml contents must be manually copied into the directory.xml before running the server. This is sub-optimal.

The following changes should be made:

1. Put better defaults into the conversion for the contents and eliminate the merge-point attribute (it is not used).
2. Write the contents into the name_map.xml which automatically gets loaded from the application jar at server startup. The file_sys.xml is no longer needed at this point.
3. Update the runtime to read the values from there. The source name mapper is the place that manages the file.
