The -maxConnections, -connectionLifetime, -nosessionreuse and -nohostverify options are not yet implemented by web service's CONNECT runtime.

Implementation for these options will not be trivial. There probably will be needed changes to AXIS2 core to allow persistent connections and to validate the SSL Host and reuse the SSL Session. Host's SSL certificate validation may be done separately (by establishing a connection just to make sure the target host is known), but SSL Session reuse is linked to AXIS2 code.
