Description			

History

#1 - 12/02/2004 01:52 PM - Nick Saxon

@18854 - Definition:

In any single run the preprocessor only can produce one particular variation of the source. If the source contains no `&IF - &THEN - &ELSE - &ENDIF` statements, this is the only variation possible. Otherwise, it's just one of many possible variations with all others left unseen.

This new mode of preprocessor operation should generate all possible variations of the file in a single run so all variations can be seen.

Those can potentially be generated as a set of completed files or as a single file with all variations in it as just code blocks (commented appropriately).

#2 - 04/12/2012 11:23 AM - Greg Shah
