Found issue in trunk for hotel GUI. When window is restoring from maximized state by restore title bar button the window size is not changing but location is changed to become negative so the top-left corner of the window is moving outside the visible area.

In some hotel screen press maximize and then restore button in Web client mode. The application window is not restoring but moving with top-left corner to become outside the visible area (negative coords I guess).

This can be recreated in trunk revision 11248 (and before). It is not related to the changes from [#3548](#), but was just found during that work.

Eugenie confirmed this is not an issue in Swing.

To be clear. The Swing portion of the issue is the window size is not changed when it should for restore action. After window become maximized this max size must be changed to one we had before max button event.
