If you are working on a very large project, it *might* be beneficial to having a way to archive the front-end artifacts. I just wanted to get feedback on whether or not a dependency such as the below, would be of any benefit. It would be a type of "un-clean".

```
<target name="archive" description="Archive all generated files from the conversion process." >
  <delete file="${appname}_artifacts.zip"/>
  <zip destfile="${appname}_artifacts.zip" basedir="${basedir}" filesonly="true"
    excludes="${app.4gl.src}/skeleton/*
              ${app.4gl.src}/possenet/*"
    includes="ui_strings.txt
              orphan-frames.dat
              schema-triggers.xml
              internal_procedures.xml
              name_map.cache
              file_sys.xml
              name_map.xml
              function_return_types.xml
              duplicate_function_return_types.xml
              cfg/registry.xml
              adm_windows.json
              embedded/src/resources/adm_windows.json
              **/*.pphints
              **/*.cache
              **/*.lexer
              **/*.parser
              **/*.ast
              **/*.ast.original
              **/*.jast
              **/*.dict
              **/*.p2o
              **/*.schema
              **/*.log"
  />
</target>
```
