The following dependencies are (hopefully) unnecessary complications in our installation process. They cause extra effort. Worse, they invariably cause some non-trivial number of failures and diagnosis time in getting to a working FWD installation.

These are the dependencies to eliminate:

- #4550 eliminate the need to place the p2jspi.jar in the JVM extension directory
- #4551 replace PL/Java usage with a less intrusive approach
- #3871 determine how to change codepages/locales during import (this task will allow us to offer the shift from 8859-1 to UTF-8, which would make the setup of PostgreSQL much easier by eliminating the need for the en_US@p2j_basic custom locale)
- #2660 evaluate if the NCURSES 5.7 "threading improvements" can be made to work for P2J such that auto_getch_refresh() is no longer needed
- If #2660 does not work, then a fallback plan is to statically link to ncurses (see #5167).
- #5568 implement application-specific TERMINFO database overrides
- #6340 move JNI and native dependencies into the jar
