In a ChUI browse the current row can be out of the view. It is a rare case and I'm aware only of one case when this happens in ChUI: when REPOSITION TO ROWID fails. See #4500-73 which describes the original issue.

So far the solution implemented is stateless. But the testcase uast/browse/browse-chui-out-of-view.p shows that while the top row is not highlighted, it is considered to be the focused row and can be selected/deselected using (DE)SELECT-FOCUSED-ROW (or DESELECT-ROWS), which probably means that we have to manage this quirky browse state in a stateful manner.

When someone will be resolving this task, he'll want to change the code in BrowseImpl.SpaceColumnRenderer.addMarks(int) for a start.
