We have multiple requests for changes to the default approach to some PostgreSQL schema. We have a small window right now in which we can tolerate some improvements to the schema. The obvious changes:

- use of a native case-insensitive data type (citext?) for character instead of using TEXT and accessing it using UPPER(RTRIM()) (see also [#2949](#))
- doing a non-crappy job of extent column support (see [#4060](#), [#4058](#) and [#6418](#))

Eric: Am I missing anything here?
