I suggest to make call site names more readable. E.g. I have to click each of this sites to understand what this code is about:

```
RUN_CALL_SITE_500.clone().setInHandle (hpApi).run (fMainFrame.getHWND ());  
RUN_CALL_SITE_501.clone().run ();  
RUN_CALL_SITE_502.clone().setInHandle (hpApi).run (new integer (0));
```

If call site name contains the name of the corresponding function, it looks much more readable:

```
someproc1_RUN_CALL_SITE_500.clone().setInHandle (hpApi).run (fMainFrame.getHWND ());  
ADM_openquery_RUN_CALL_SITE_501.clone().run ();  
someproc2_RUN_CALL_SITE_502.clone().setInHandle (hpApi).run (new integer (0));
```

I think we can provide this as an option, though if we do we will want to reduce some of the text (maybe remove the _CALL part).
